- Step 3: Display the values X, Y before swapping
- Step 4: Assign Create a temporary variable temp
- Step 5: Assign X to temp
- Step 6: Assign temp to Y
- Step 7: Display the values X, Y after swapping.

PROGRAM

```
# Python program to swap two variables
```

```
X = 5
```

```
Y = 10
```

```
# To take inputs from the user
```

```
X = input('Enter value of X :')
```

```
Y = input('Enter value of Y :')
```

```
print('Before Swapping')
```

```
print('X=', X, 'Y=', Y)
```

```
# Create a temporary variable and swap the values
```

```
temp = X
```

```
X = Y
```

```
Y = temp
```

```
print('The value of X after swapping: {}'.format(X))
```

```
print('The value of Y after swapping: {}'.format(Y))
```

Output

Enter the value of X : 5

Enter the value of Y : 10

Before swapping

X = 5 Y = 10

The value of X after swapping : 10

The value of Y after swapping : 5

In this program, we use the temp variable to hold the value of X temporarily, we then put the value of Y in X and later temp in Y. In this way, the values get exchanged.

ABSTRACT

Sign language is a vital means of communication for individuals with hearing impairments, enabling them to express themselves and interact with the world. Developing a reliable and efficient system for real-time sign language detection has become increasingly important in facilitating seamless communication between individuals who use sign language and those who do not. This code presents a comprehensive solution that combines computer vision and deep learning techniques to detect and interpret sign language gestures in real-time. By leveraging the power of image processing and machine learning algorithms, the code can accurately recognize and translate sign language gestures into text or speech, providing a valuable tool for bridging the communication gap between hearing-impaired individuals and the wider community.
